Vector control, also called field-oriented control (FOC), is a variable-frequency drive (VFD) control method in which the stator currents of a three-phase AC electric motor are identified as two orthogonal components that can be visualized with a vector. One component defines the magnetic flux of the motor, the other the torque. The control system of the drive calculates the corresponding ...

Introduction. Digital motor control has been a challenging subject since the beginning of early implementations. Although digital control techniques and the availability of high-speed microcontrollers made life significantly easier for engineers, highly non-linear motor models, designing and tuning multiple control loops, math intensive sensorless algorithms, parameter and temperature ...

Direct torque control (DTC) is one method used in variable frequency drives to control the torque (and thus finally the speed) of three-phase AC electric motors. This involves calculating an estimate of the motor's magnetic flux and torque based on the measured voltage and current of the motor.

Now you should be able to start the program and connect to the motor controller. A short tutorial to run a motor. In this section I will describe how to run an outrunner motor in sensorless mode from Ubuntu Linux. The reason for using an outrunner is that the parameters in the github project are tuned to work with most of my outrunners that I have at home.
