and solve a natural gas combustion problem using the non-premixed combustion model for the reaction chemistry. This tutorial demonstrates how to do the following: • Define inputs for modeling non-premixed combustion chemistry. • Prepare the PDF table in ANSYS FLUENT. • Solve a natural gas combustion simulation problem.

In Cylinder Specific Models for Fluent 6.2 Several in-cylinder specific models have been implemented into Fluent 6.2, among these are a spark model for premixed engines, an autoignition model for knocking in premixed engines and an ignition delay model specifically for direct injection diesel engines.

Simulation of Wave Generation in a Tank i. Select water-liquid (h<sub>2</sub>o<l>) from the Fluent Fluid Materials list. Scroll down to view water-liquid. ii. Click Copy and close the panel. (b) Click Change/Create and close the panel. Step 4: Phases • Phases... 1. Set air as primary phase and water as secondary phase. (a) Under Phase, select phase-1.

Fluent CFD simulation settings were illustrated in details for a diesel burner with air swirler, using non-premixed combustion model with lean combustion and probability density function (PDF). Discrete phase model (DPM) was used for the evaporation and ejection processes of diesel fuel.

CFD simulation of combustion in a Diesel engine (sector mesh). The video shows the evolution of the

temperature field. Fuel injection, fuel / air mixing, auto-ignition, flame propagation and stabilisation and mixture burn-out are all well captured.

ANSYS Fluent software contains the broad physical modeling capabilities needed to model flow, turbulence, heat transfer, and reactions for industrial applications—ranging from air flow over an aircraft wing to combustion in a furnace, from bubble columns to oil platforms, from blood flow to semiconductor manufacturing, and from clean room design to wastewater treatment plants.
